FLSmidth Krebs produces different types of Cyclones to meet the customer’s specific requirements. Each type of Cyclone comes in different sizes with different internal fittings to optimize the performance for every application. The most commonly used cyclones for removing cutting solids from drilling mud are urethane 4” (desilters) and urethane 10” (desanders).

The Krebs urethane gMAX cyclones are a new generation of cyclones that were developed through extensive CFD studies. These cyclones have higher capacities and can make finer and sharper separations than other cyclones on the market.

FEATURES & BENEFITS

- Low capital cost and no moving parts
- Finer separations
- Sharper separations
- High capacity in a small footprint
- Minimal maintenance requirements
- Krebs Cyclones are designed to fit customer’s connections
