KREBS®
PUMPS, CYCLONES AND VALVES

gMAX®
Molded Urethane Cyclones
Most separation equipment demands you make a choice. You end up sacrificing production, wear life and even end product quality looking for the best solution to your wet processing needs. Our urethane cyclones are different. You gain the best of all worlds – from capital outlay to capacity to quality to long wear life.

**Key benefits**

- Finer, sharper particle separations
- Fewer cyclones needed for optimal performance
- Low capital cost
- No moving parts; wear resistant for long service life
- Minimal maintenance required
Their lightweight construction, small footprint, and ease of handling make them a good option for both mining and industrial applications. Quality urethane construction delivers the abrasion and corrosion resistance you require.

And with no moving parts, they require minimal maintenance. Available in KREBS® patented gMAX® geometry, the performance is second to none.

In high-process capacities, numerous urethane cyclones can be manifolded together into radial or inline configurations that work within tight spaces. As an added benefit, we can easily retrofit urethane cyclones into your existing processes.

Urethane cyclone applications
- Water treatment
- Minerals processing
- Coal processing
- Industrial
The highs and lows of running your operation are easily reflected in your wet processing needs. You demand high capacity and low maintenance. Optimum product quality and minimum downtime. Long service life and low capital outlay. Your operation depends on equipment that will perform as it is designed to do — day in and day out.

Exceptional resistance to corrosion. Light weight construction for ease of handling and installation.
A full line of moulded urethane separation solutions

We offer a complete line of KREBS® urethane hydrocyclones ranging in size from 13 mm to 254 mm (.5-in to 15-in) in diameter. Separation d50’s as fine as 3 microns are possible, with flow rates per cyclone ranging from 2.27 litres per minute (6 gpm) to 5,300 litres per minute (1,400 gpm). We can combine multiple units into a manifold arrangement for unlimited capacities.

Our gMAX® technology is available in most urethane sizes. The gMAX cyclone incorporates modern apex and cone designs that feature performance-enhancing benefits. We modified the cyclone inlet and cylindrical sections to minimise turbulence and wear, but still provide the capability to operate at much higher capacities than other hydrocyclones of the same diameter.

We analyse your separation requirements to determine your required cyclone size. If your process flow exceeds the capacity of an individual cyclone, we recommend installing multiple cyclones on a common manifold to achieve your necessary process capacity. Cyclone manifolds are available in a variety of configurations and are custom tailored to your application.

We also provide food grade urethane cyclones for drinking water and food processing applications.

Canister manifold system
A radial manifold with integral overflow/underflow launders that share a common wall. Canister manifolds typically are rubber-lined, and generally offer better access to isolation valves for operational flexibility and maintenance purposes.
Pod System
Where 1” or 2” diameter cyclones are required for the desired separation and process flows are very large, pod style manifolds combine several standard size cyclone “pods” onto a radial manifold system. This provides very high capacity while offering some turndown capability, spare capacity, and fewer valves to maintain.

Spider manifold system
A spider radial manifold design commonly used with small-diameter (less than 152 mm or 6-in) cyclones. The primary advantage is a very small footprint and reduced underflow launder size. Spider manifolds are more suited to process low concentration, relatively non-abrasive slurries.

Inline manifold system
Generally appropriate only for processing of fine solids that do not readily segregate in the pipe. Benefits include lower cost and a geometry that typically connects more easily to plant piping. Typical applications include, removal of fine solids in chemical and water treatment processes.
Space saving knife gate valve that can perform as well as a wide body valve

We designed a space saving wafer-style knife gate slurry valve for light to heavy duty applications.

Bringing better solutions to light  
in the cement and mining industries

The future is full of possibilities and you are leading the way. But it’s never a straight journey and it’s easy to lose sight of true potential. With an ally by your side, who shares your ambitions and who sees your world from different angles, we will find the right way together.

For more than 135 years, we have challenged conventions and explored opportunities. Across more than 50 countries, we are 13,000 employees who combine our unique process-knowledge on projects, products and services to drive success. We develop the most advanced technology in our industries and offer market-leading product and service ranges.

Rooted in Danish values, we activate our knowledge and experience to navigate your complexity and bring better solutions to light. So no matter where in the world you are, we are here to help you discover new ground and achieve sustainable productivity enhancement.

We are the market-leading supplier of engineering, equipment and service solutions to customers in the global mining and cement industries.

We discover potential.
